

Legacy Installer Migration Review

About TLUX

Since 2015, TLUX Technologies has been the global training and consulting partner at Revenera, the makers of InstallShield™ and more. Our teams in the USA and Europe leverage over 25+ years' experience in this field.

About InstallShield

Today's environments are complex with an ever-expanding list of requirements, deployment needs and nuances to consider. New Windows versions, virtualization needs and emerging platforms such as Universal Windows Platform and Docker.

Consistent and reliable installations are the goal, every time, everywhere. InstallShield allows you to choose various formats – both standalone or complex suites. Develop MSI/X and EXE installers, Universal Windows Platform (UWP) and Windows Server App packages, ready for Windows Store and Nano Server to name a few.

Engagement Overview

Our **'Legacy Installer Migration Review'** engagement gives an expert analysis of your installation projects whether they be **InstallScript or Wise Script based** and provide feedback on its structure, potential problem areas and their impact and resolution.

Installation projects grow organically over time and as new requirements arise organically, rather than by design and with flexibility and futureproofing in mind, especially when it comes to updates, and this technology has matured greatly in recent years – giving new benefits.

Often, the expertise of whoever originally created such installations has been lost and so those inheriting this responsibility are left needing expert guidance in terms of the way forward in order to maintain and serve your customers.

Your existing installers may (*unknowingly*) contain open source or 3rd party components, presenting security vulnerabilities, compliance issues and maintainability challenges. Rearing their heads when you least expect it!

Updating your project to the latest version of InstallShield is not a 'one-click' operation, an expert eye is needed to ensure it is well-formed and ready.

Poor installers do not yield long term clients and will push up support costs and degrade your customer satisfaction. Your installation is often the first experience of your product to clients.

Engagement Approach

Taking place remotely over 5 days (*for up to 2 InstallShield projects*), we work with your team such as installation/software engineers, marketing and product management (*amongst others*) to understand the landscape and background to your installer(s). This can include sharing any particularly troublesome areas such as deployment, virtualisation or patching/updating to name a few.

We then do a deep-dive into your project(s) taking several areas into account and documenting that in full detail within the resulting summary report, providing a 'heatmap' based on score for each area.

This ensures we get a well-rounded view of your installation project (*whatever its structure*) and are able to critique the various aspects of its structure, function and dependencies to provide an overview of what areas will need some modification and the effort/approach/cost of how we could help you to facilitate that in order to get your installation updated with the latest in best practices and therefore future-proofing it, adding flexibility with regards updating and at the same time helping you to maximise your investment in the latest InstallShield platform and all its capabilities:
